

BEACON project OPTIMA (autologous or heterologous plugs in vitrectomy for the surgical management optic disc pit maculopathy)

Guide to fill the database

Most of the fields can be populated using the multiple choice in the database.

- Case Code: initials of the surgeon submitting the case followed by 2 digits in progressive order (e.g. MF01, MF02, MF03, etc.)
- Relevant Ophthalmic History: free text to include any previous ocular medical or surgical treatment, except for previous surgeries for the optic disc pit maculopathy
- Where relevant, time to recurrence and duration of symptom recurrence: to be filled only in case of resolution of maculopathy after the primary surgery. Otherwise, please write "N/A"
- CMT: area of 1-mm diameter centred on the foveal centre

Images required: OCT over the macular area allowing the calculation of central foveal height, central macular thickness (1-mm diameter centred on the foveal centre) and macular oedema extent, OCT over the disc. The images will be identifiable only by study number. Please, note that **images must be anonymised**.
